Re: Senior Data Scientist, AI Evaluation, Syllo

Dear Syllo hiring team,

Your posting asks for someone who measures how an AI system behaves, runs experiments to compare approaches, and finds root causes. I did that work for ten years as a validation engineer at Zebra Technologies, and I do it now on Purvia, my open-source retrieval and support-bot project.

The best example is an eval that went wrong. My escalation eval checks that a support bot hands questions it can't answer to a person, with a 5% ceiling on wrong auto-answers. It breached that ceiling four runs in a row, reaching 27%. Before touching the product, I ran the pipeline end to end with only its live gates and got 0 false resolves in 55 runs. The fault was the offline LLM judge. Once it could see the retrieved context, it graded whether a draft was true, not whether it answered the question, so an accurate "I don't have that information" passed. I compared five judge designs on replayed drafts and kept the one that makes the judge name the asked and stated values first. Wrong verdicts went from 38 of 280 to 0 of 300.

I treat model choices as experiments with a price. For the live answer gate, a stronger judge model let 15 of 66 should-escalate drafts through on 85 stored drafts, while a stricter rubric on the current model let 1 through, for about $0.00007 more per reply, so I kept the rubric. On retrieval, a 60-question benchmark scores vector, keyword, and hybrid search on pull requests, and when a RAGAS gate flagged a question that retrieved nothing, I traced it to keyword stemming and raised hybrid recall@5 from 0.950 to 0.967.

Production data at your scale would be new to me, since Purvia runs on a synthetic corpus, and so would litigation. I'd start by learning how your lawyers judge a good answer, then build the measurements around that. I'd welcome a conversation about how you evaluate your agentic features today.

Sincerely,
Hyung Cho
